Software engineer with 2 years of experience developing modern web and mobile applications using Angular, React, Next.js, Ionic, TypeScript, Node.js, and NestJS. Skilled in frontend architecture, backend API development, database integration, authentication, and end-to-end application development. Experienced in building scalable, responsive, and maintainable software with a strong focus on performance and user experience.

EXPERIENCE

Convsys Technology Pvt Ltd

Sept 2024 – Present

Software Engineer

Makarba, Ahmedabad, Gujarat, India.

- Developed and maintained Angular web applications and Ionic-based mobile apps for Android, iOS, and PWA, supporting the company's core product across platforms.
- Implemented reactive programming patterns using RxJS to manage complex asynchronous flows and application state.
- Integrated RESTful APIs and collaborated closely with backend teams to ensure smooth, reliable feature delivery.
- Built and maintained company websites using Next.js, with a focus on performance, SEO, and scalability.
- Contributed to backend development (~40% of workload) using NestJS, building REST APIs and microservices.
- Continuously improved applications based on user feedback and evolving business requirements.

Freelance

Oct 2023 – Sept 2024

Frontend / Full-Stack Developer

Remote, India/Malaysia.

- Delivered frontend-focused freelance projects using React and Next.js, building responsive UIs with HTML, CSS, SCSS, and JavaScript.
- Optimized client websites for performance, SEO, and scalability by applying Next.js best practices.
- Developed REST APIs using Node.js and Express.js to support frontend functionality.
- Designed and managed databases using PostgreSQL and Prisma ORM.
- Managed full project lifecycle – requirement gathering, development, testing, and client feedback – for multiple independent clients.

PROJECTS

DocoPilot

Technologies: React.js, WebSocket, Supabase, Docker, Node, Express

- Architected and built DocoPilot, a full-stack, self-hosted Docker fleet-management platform enabling remote container/image lifecycle management (create, inspect, logs, remove) and monitoring across multiple servers from a single web dashboard.
- Designed a secure agent-server-client architecture using outbound-only WebSocket connections with HMAC-signed handshakes and per-server credential pairs, eliminating the need to expose Docker sockets or open inbound ports on managed hosts.
- Implemented a webhook-based alerting system (container crash detection, CPU threshold monitoring with cooldown throttling) and transactional email flows (verification, password reset) via Resend, alongside JWT auth, AES-256-GCM encrypted credential storage, and Zod-validated APIs.
- Established production-readiness practices from the ground up: structured logging (Pino), a persisted audit trail, automated tests (Vitest), and CI/CD pipelines (GitHub Actions) for multi-service builds and container image publishing.
- Built a responsive React 19 dashboard (Vite, Tailwind, Zustand, TanStack Query) with real-time WebSocket-driven container/image management, live resource-usage trend charts, and multi-server fleet oversight.

Project Vault | Local-First Project Management Desktop Application

Technologies: Electron, React, TypeScript, Node.js, Express.js, PostgreSQL, Prisma ORM, Socket.IO, REST API, JWT, Supabase, Tailwind CSS, TanStack React Query, Vite, Zod, Bonjour (mDNS), Windows (NSIS)

- Architected and developed a full-stack desktop project management application using Electron, enabling teams to manage projects locally without relying on cloud-hosted project data.
- Implemented a dual-database architecture with Supabase (PostgreSQL) for cloud authentication and local PostgreSQL for project, task, and user data using Prisma ORM.
- Built a Kanban-style project board with drag-and-drop task management, custom stages, task assignees, priorities, and due dates using React and @hello-pangea/dnd.
- Developed a RESTful backend API with Express.js and TypeScript, including authentication, authorization, and CRUD operations for projects, users, stages, and tasks.
- Integrated real-time updates across clients using Socket.IO for live collaboration on project boards and task changes.
- Designed an admin-client networking model where an admin hosts the local database and team members connect over LAN using Bonjour (mDNS) service discovery and manual IP configuration.
- Created a first-time setup flow to download, initialize, and configure local PostgreSQL binaries for offline/local-first deployment.
- Built a responsive React frontend with TypeScript, React Router, TanStack React Query, and Tailwind CSS for state management, routing, and UI Components.
- Packaged the application for Windows distribution using Electron Builder and compiled the backend into a standalone executable for production deployment.
- Implemented form validation and type-safe API contracts using Zod and TypeScript across frontend and backend.

SQL Inspector (npm: <https://www.npmjs.com/package/sql-inspector>)

Technologies: Node.js, JavaScript (ES Modules), WebSockets, HTML/CSS, SQLite, Capacitor, npm

- Built and published an open-source npm dev tool that lets developers browse live SQLite data from mobile and hybrid apps in a browser—without pulling .db files or using platform-specific IDE inspectors.
- Designed a 3-tier architecture (vanilla browser UI ↔ Node.js relay server ↔ in-app WebSocket client) with a pluggable DataSource adapter pattern so any embedded database can plug in via two methods: listTables() and getTableData().
- Implemented a non-invasive integration model: a few lines of dev-only bootstrap code connect to the inspector at runtime and are stripped from production builds via dynamic imports and environment guards.
- Delivered a self-hosted browser UI with table search, cross-column row filtering, pagination, JSON cell inspection, and light/dark theme—relayed over WebSocket with request/response correlation, timeouts, and auto-reconnect.
- Wrote 26 automated tests using Node's built-in test runner, covering the relay layer, WebSocket client, and full HTTP + WebSocket server end-to-end.

TECHNICAL SKILLS

Languages & Frameworks: JavaScript, TypeScript, React, Next.js, Angular, Ionic, Node.js, Express.js, NestJS, RxJS

Database & Cloud: PostgreSQL, SQLite, Prisma ORM, Supabase

Tools & Technologies: Electron, Docker, WebSockets, Socket.IO, TanStack React Query, Tailwind CSS, Vite, Zod, Git, GitHub

Core Competencies: REST APIs, Microservices, JWT Authentication, Real-Time Applications, Responsive Design, SEO, Performance Optimization, Full-Stack Development
